Broom Spurge  *Amperelea xiphoclada*

*Flowers: September to February - H 80cm x W 50cm.*

An attractive erect & rigid small plant with sculptured grass-like foliage, usually leafless in its mature form. Prefers sandy soils, but will adapt to a range of soils types from coastal to inland areas. Very hardy species, well suited to rockeries & bush-gardens especially in lighter soils. Looks v/good planted in small group. While it has small & insignificant flowers, it is most worthwhile for its foliage alone.
